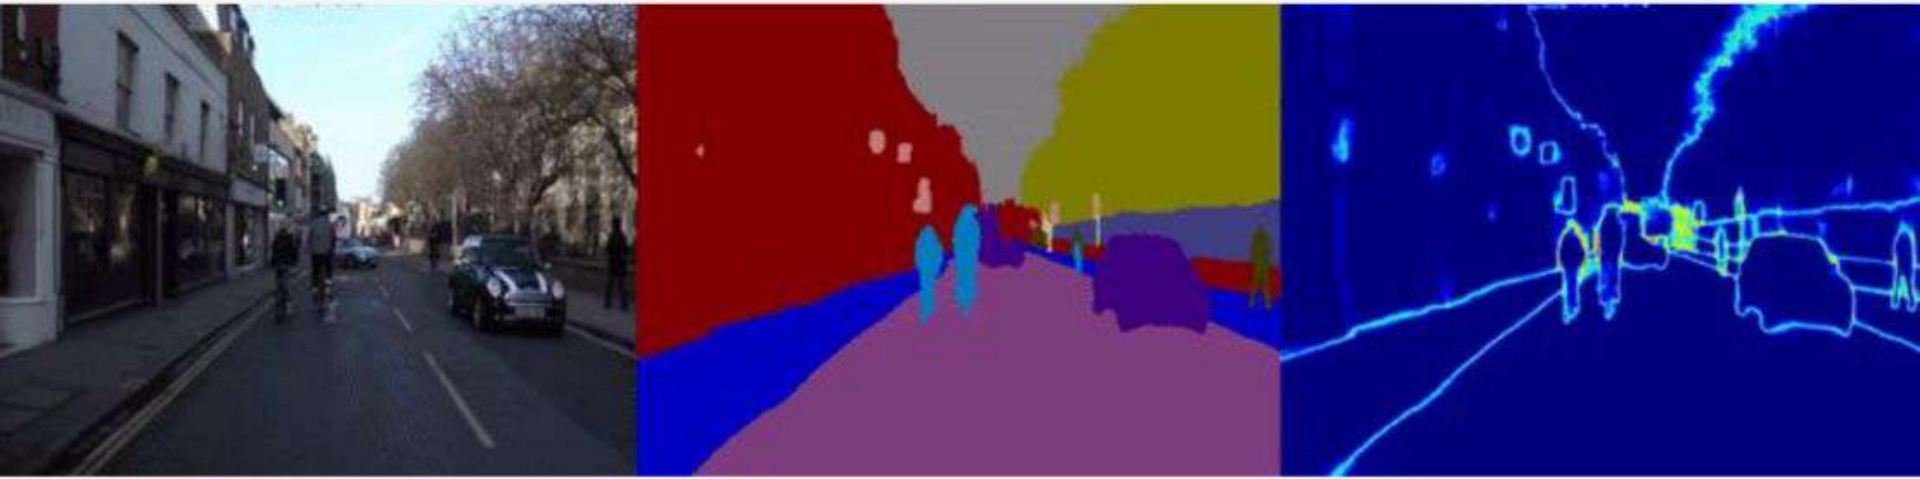
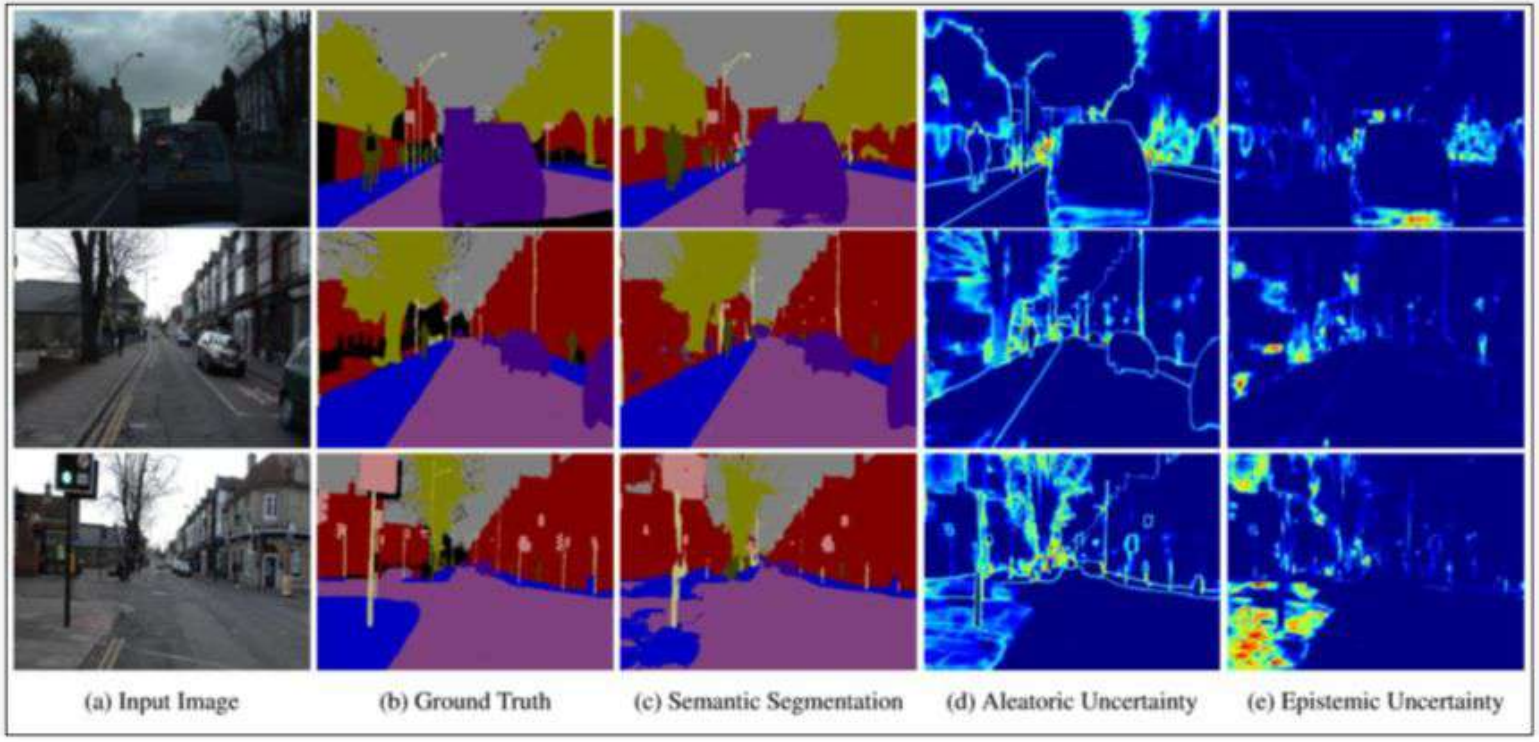
Bayesian SegNet for probabilistic scene understanding



Input Image Semantic Segmentation Uncertainty

What kind of uncertainty can we model?

Epistemic uncertainty is *modeling* uncertainty
Aleatoric uncertainty is *sensing* uncertainty



Modeling Uncertainty with Bayesian Deep Learning

Deep learning is required to achieve state of the art results in computer vision applications but doesn't provide uncertainty estimates.

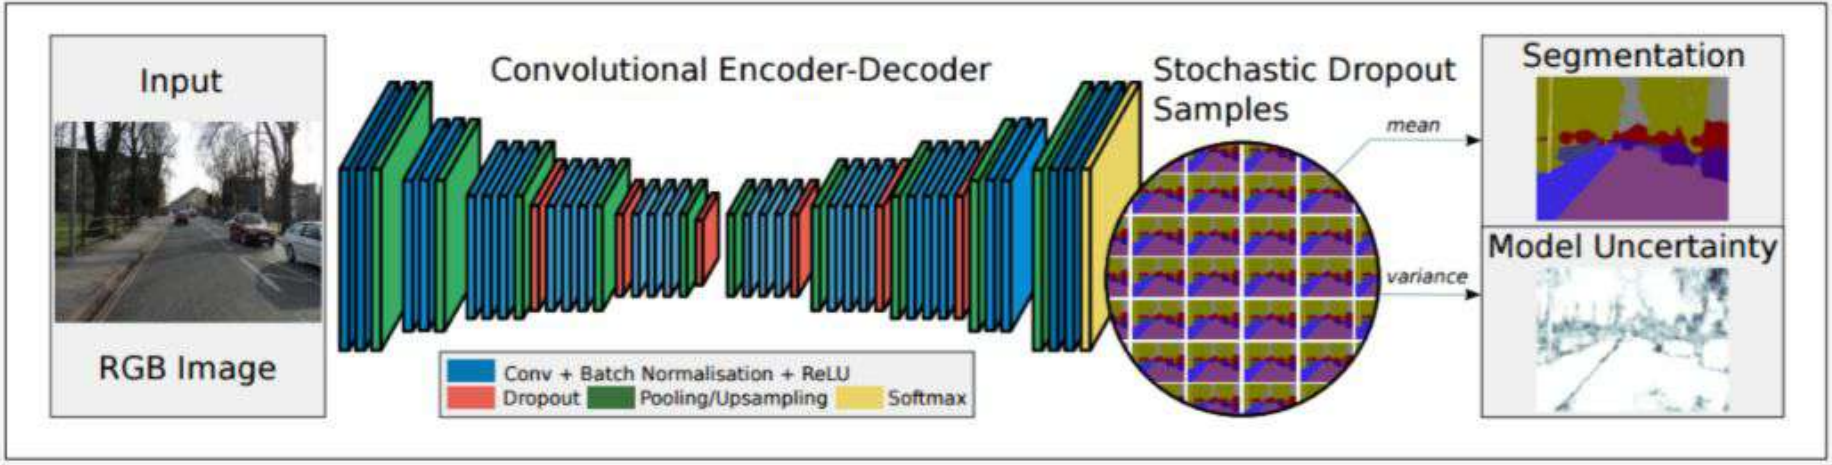
- **Bayesian neural networks** are a framework for understanding uncertainty in deep learning
- They have **distributions over network parameters** (rather than deterministic weights)
- Traditionally they have been **tricky to scale**

MacKay, David JC. **A practical Bayesian framework for backpropagation networks.** Neural Computation, 4(3): 448–472, 1992.

Modeling Epistemic Uncertainty with Bayesian Deep Learning

We can **model epistemic uncertainty** in deep learning models using Monte Carlo **dropout sampling** at test time.

Dropout sampling can be interpreted as **sampling from a distribution over models**.



Alex Kendall, Vijay Badrinarayanan and Roberto Cipolla **Bayesian SegNet: Model Uncertainty in Deep Convolutional Encoder-Decoder Architectures for Scene Understanding**. arXiv preprint arXiv:1511.02680, 2015.

Modeling Aleatoric Uncertainty with Probabilistic Deep Learning

	Deep Learning	Probabilistic Deep Learning
Model	$[\hat{y}\,] = f(x)$	$[\hat{y}, \hat{\sigma}^2] = f(x)$
Regression	$Loss = \|y - \hat{y}\|^2$	$Loss = \frac{\|y - \hat{y}\|^2}{2\hat{\sigma}^2} + \log \hat{\sigma}^2$
Classification	$Loss = SoftmaxCrossEntropy(\hat{y}_t)$	$\hat{y}_t = \hat{y} + \epsilon_t \qquad \epsilon_t \sim N(0, \hat{\sigma}^2)$ $Loss = \frac{1}{T}\sum_t SoftmaxCrossEntropy(\hat{y}_t)$

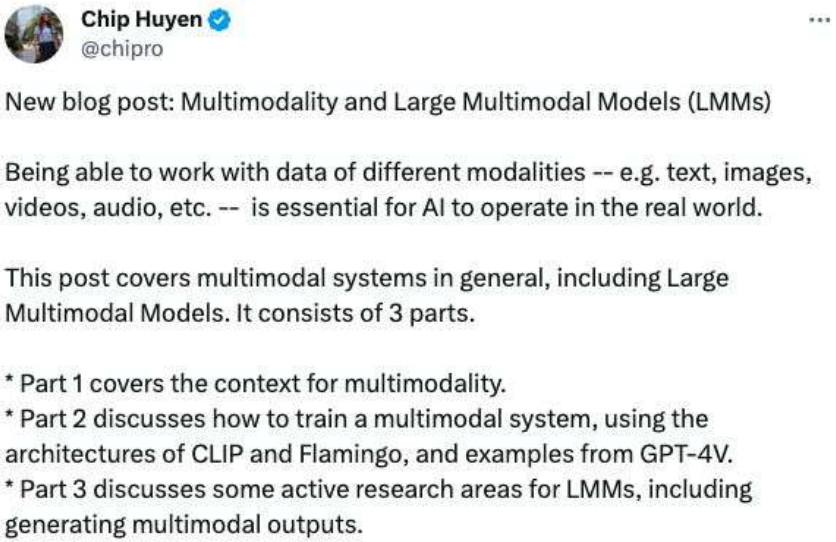
Understanding Multimodal



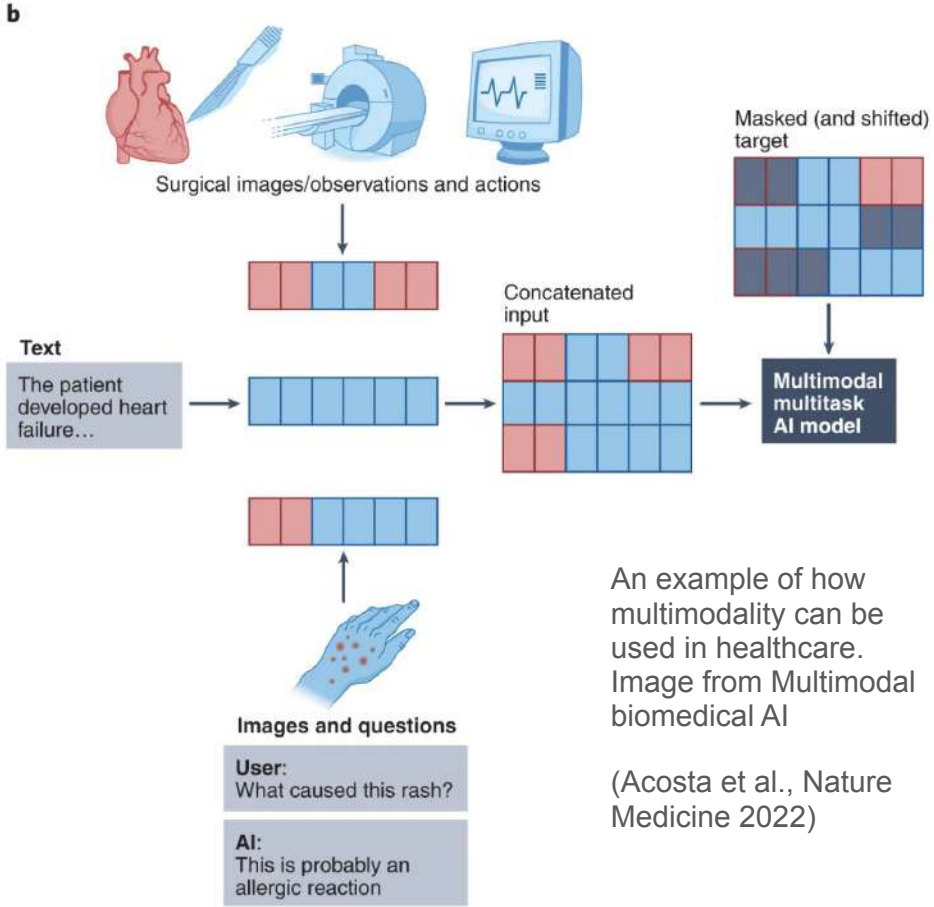
Chip Huyen
@chipro

New blog post: Multimodality and Large Multimodal Models (LMMs)

Being able to work with data of different modalities -- e.g. text, images, videos, audio, etc. -- is essential for AI to operate in the real world.

This post covers multimodal systems in general, including Large Multimodal Models. It consists of 3 parts.

* Part 1 covers the context for multimodality.
* Part 2 discusses how to train a multimodal system, using the architectures of CLIP and Flamingo, and examples from GPT-4V.
* Part 3 discusses some active research areas for LMMs, including generating multimodal outputs.



An example of how multimodality can be used in healthcare. Image from Multimodal biomedical AI

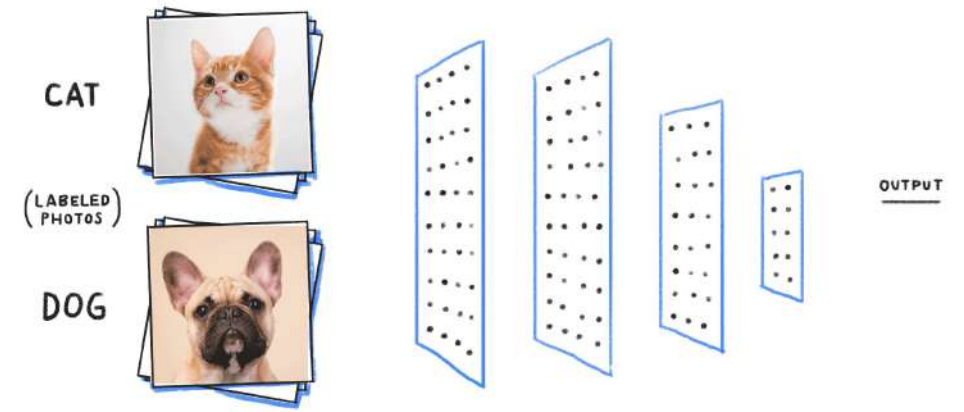
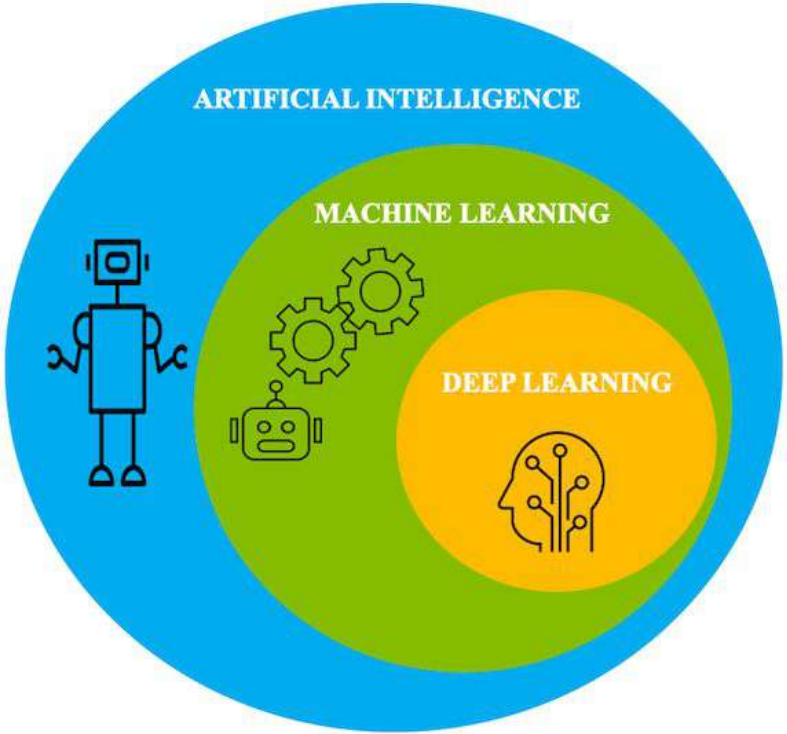
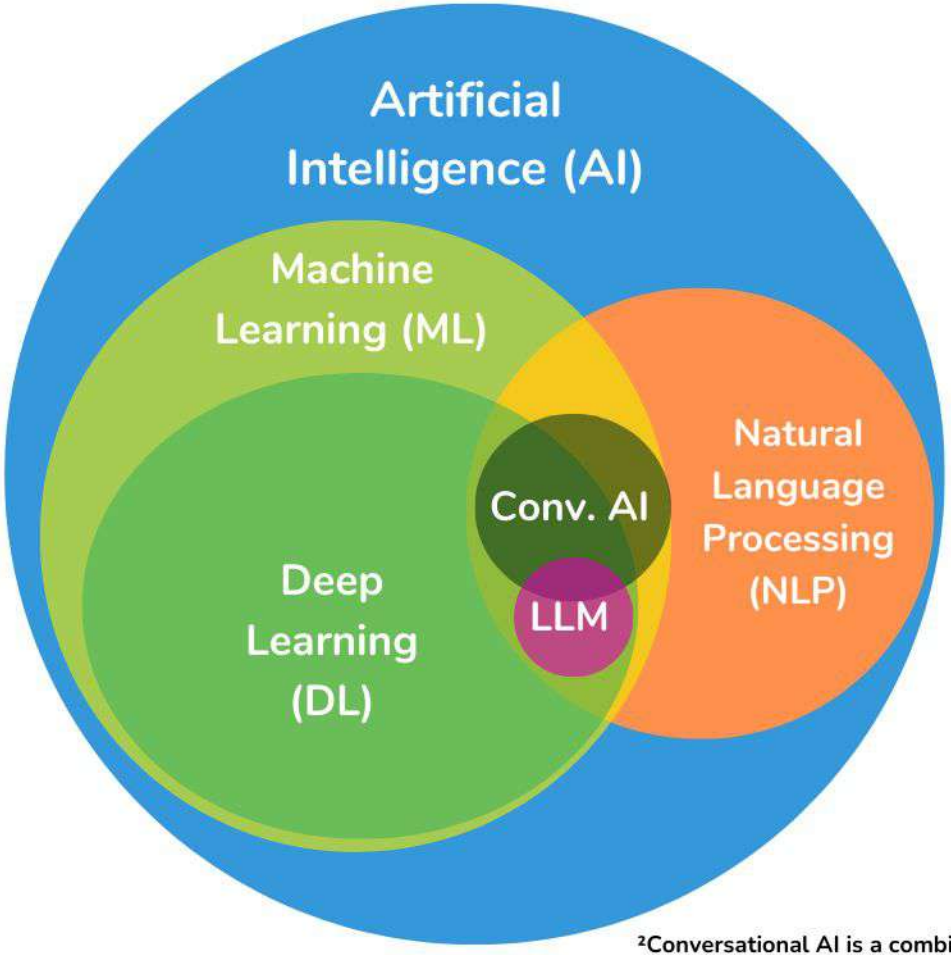
Basic AI



AI vs Machine Learning vs Deep Learning

- **Artificial Intelligence (AI)** is the concept of creating smart intelligent machines.
- **Machine Learning (ML)** is a subset of artificial intelligence that helps you build AI-driven applications.
- **Deep Learning** is a subset of machine learning that uses vast volumes of data and complex algorithms to train a model.



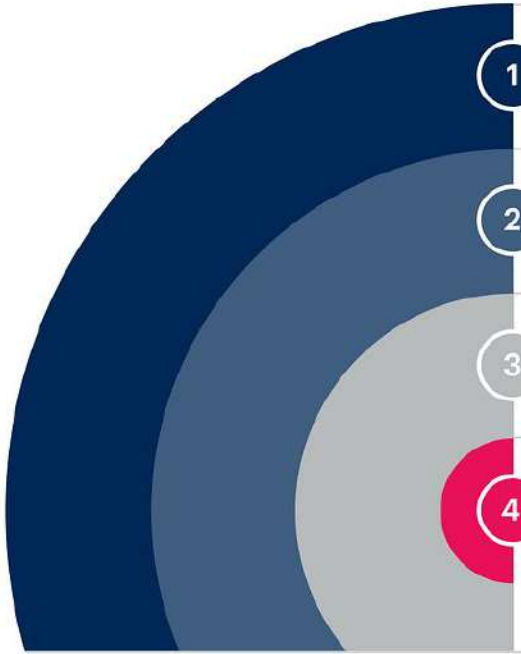


- Artificial Intelligence (AI)
- Machine Learning (ML)
- Deep Learning (DL)
- Natual Language Processing (NLP)
- Large Language Model (LLM)[1]
- Conversational AI (Conv. AI)[2]

[1]LLM is an intersection of DL and NLP

[2]Conversational AI is a combination of ML and NLP. It may include DL and LLM, but that isn't always the case.

What Is Generative AI?



1. **Generative AI** — AI techniques that learn from data about existing artifacts and use this to generate new artifacts.
2. **Foundation Models** — Large machine learning models that are trained on a broad set of unlabeled data and are fine-tuned to a wide range of applications.
3. **Large Language Models (LLM)** — AI that is trained on vast amounts of text to interpret and generate human-like textual output.
4. **ChatGPT** — An OpenAI service that incorporates a conversational chatbot with LLM to create content.

Difference between Artificial Intelligence and Artificial General Intelligence (AGI)

Artificial Intelligence (AI)	Artificial General Intelligence (AGI)
• AI mimics human intelligence. • AI is trained by data scientists on specific, singular, or a limited number of tasks. Examples: image recognition, speech-to-text transcription, text generation, chatbots. • Is not self-aware; has no consciousness or ability to think on its own.	• AGI equals human intelligence, theoretically. • AGI possesses common sense and creativity and expresses emotions. • Has the ability to learn, apply knowledge, generalize, and plan ahead. • Not fully realized yet. Some doubt if it ever will be.

Machine Learning

Narrow Artificial Intelligence (ANI)

Stage One: Machines imitate human behavior, specializing in one area to solve a problem.

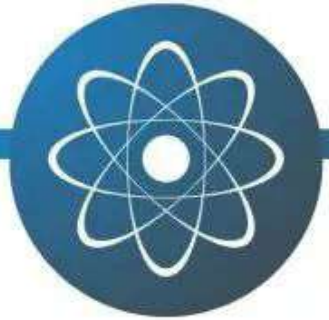
i.e. Siri, ChatGPT, Alexa

Machine Intelligence

Artificial General Intelligence (AGI)

Stage Two: Machines can continuously learn and are as smart as humans.

Machine Consciousness



Artificial Super Intelligence (ASI)

Stage Three: Machines that are smarter than humans across the board.

ENDLESS ORIGINS

Forward-Forward Algorithm: Will it replace Backpropagation?

The Forward-Forward Algorithm: Some Preliminary Investigations

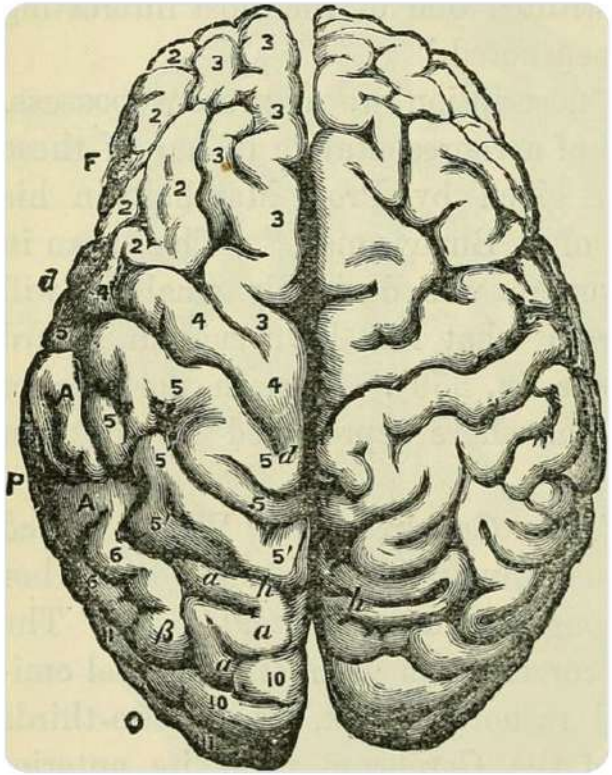
Geoffrey Hinton
Google Brain
geoffhinton@google.com

Abstract

The aim of this paper is to introduce a new learning procedure for neural networks and to demonstrate that it works well enough on a few small problems to be worth serious investigation. The Forward-Forward algorithm replaces the forward and backward passes of backpropagation by two forward passes, one with positive (*i.e.* real) data and the other with negative data which could be generated by the network itself. Each layer has its own objective function which is simply to have high goodness for positive data and low goodness for negative data. The sum of the squared activities in a layer can be used as the goodness but there are many other possibilities, including minus the sum of the squared activities. If the positive and negative passes can be separated in time, the negative passes can be done offline, which makes the learning much simpler in the positive pass and allows video to be pipelined through the network without ever storing activities or stopping to propagate derivatives.

Martin Görner @martin_gorner · Dec 5, 2022

I seems very unlikely that the human brain uses back propagation to learn. There is little evidence of backprop mechanics in biological brains (no error derivatives propagating backwards, no storage of neuron activities to use in a packprop pass, ...).



Martin Görner
@martin_gorner

Also, the brain can learn from a continuous stream of incoming data and does not need to stop to run a backprop pass. Yes, sleep is beneficial for learning somehow, but we can learn awake too.

Abstract

The dominant sequence transduction models are based on complex recurrent or convolutional neural networks that include an encoder and a decoder. The best performing models also connect the encoder and decoder through an attention mechanism. We propose a new simple network architecture, the Transformer, based solely on attention mechanisms, dispensing with recurrence and convolutions entirely. Experiments on two machine translation tasks show these models to be superior in quality while being more parallelizable and requiring significantly less time to train. Our model achieves 28.4 BLEU on the WMT 2014 English-to-German translation task, improving over the existing best results, including ensembles, by over 2 BLEU. On the WMT 2014 English-to-French translation task, our model establishes a new single-model state-of-the-art BLEU score of 41.0 after training for 3.5 days on eight GPUs, a small fraction of the training costs of the best models from the literature.

(a) image (b) semantic segmentation

(c) instance segmentation (d) panoptic segmentation

Stuff & things in panoptic segmentation

Things: In the realm of computer vision, "things" typically refer to objects that

$$\mathrm{PQ} = \underbrace{\frac{\sum_{(p,g)\in TP} \mathrm{IoU}(p,g)}{|TP|}}_{\text{segmentation quality (SQ)}} \times \underbrace{\frac{|TP|}{|TP| + \frac{1}{2}|FP| + \frac{1}{2}|FN|}}_{\text{recognition quality (RQ)}}.$$

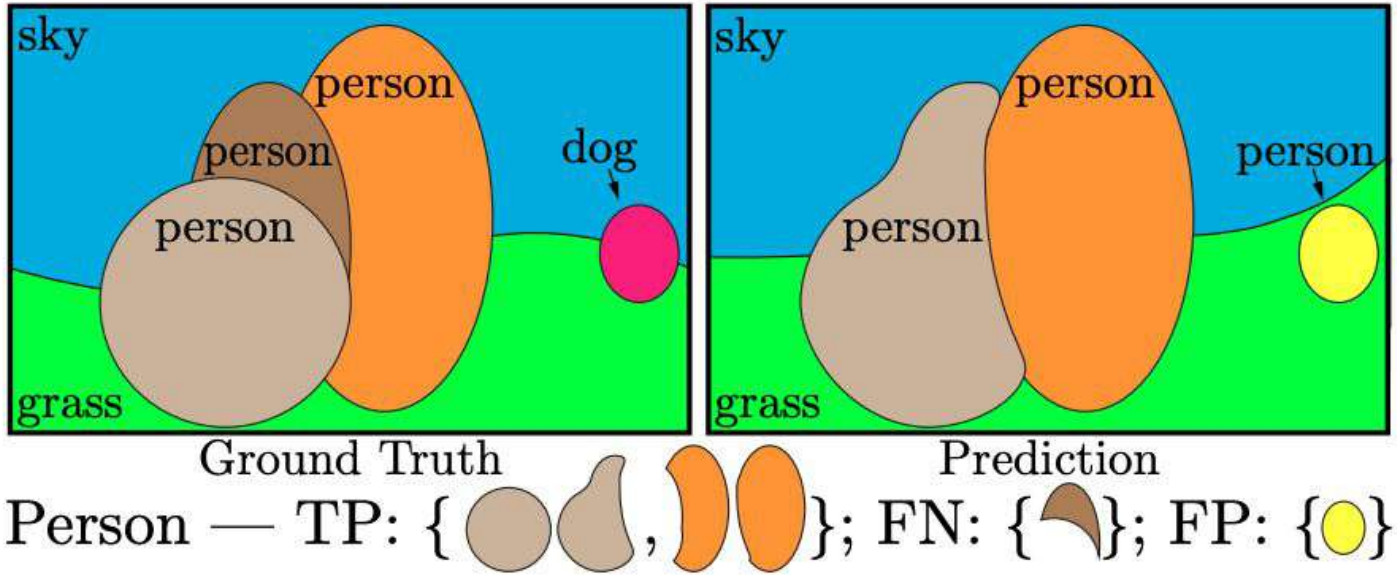

Figure 2: Toy illustration of ground truth and predicted panoptic segmentations of an image. Pairs of segments of the same color have IoU larger than 0.5 and are therefore matched. We show how the segments for the *person* class are partitioned into true positives TP, false negatives FN, and false positives FP.

$$\mathrm{PQ} = \underbrace{\frac{\sum_{(p,g)\in TP} \mathrm{IoU}(p,g)}{|TP|}}_{\text{segmentation quality (SQ)}} \times \underbrace{\frac{|TP|}{|TP| + \frac{1}{2}|FP| + \frac{1}{2}|FN|}}_{\text{recognition quality (RQ)}}.$$

MaX-DeepLab: Dual-Path Transformers for End-to-End Panoptic Segmentation

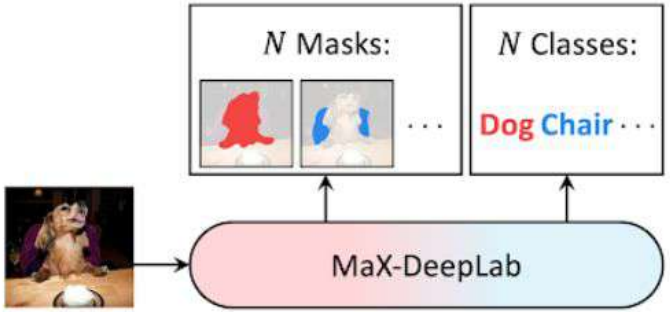
An overview of the dual-path transformer architecture.

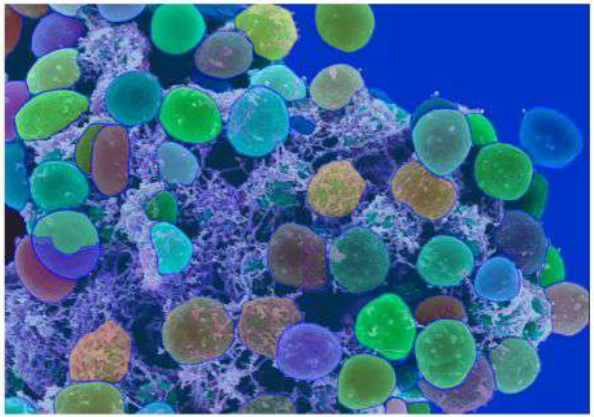


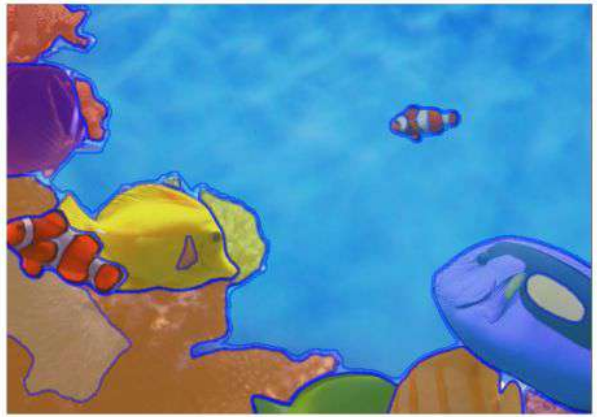
MaX-DeepLab directly predicts N masks and N classes with a CNN and a mask transformer.

When the centers of the dog and the chair are close to each other, Axial-DeepLab merges them into one object.

Segment Anything Model (SAM)

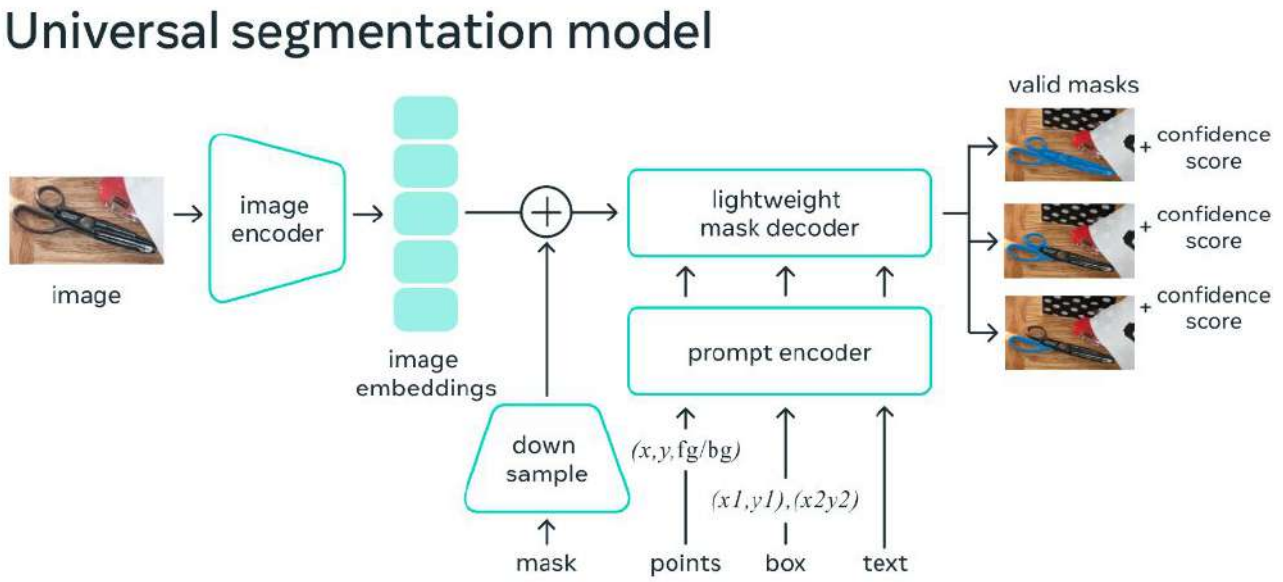
- a new AI model from Meta AI that can "cut out" any object, in any image, with a single click





https://ai.meta.com/blog/segment-anything-foundation-model-image-segmentation

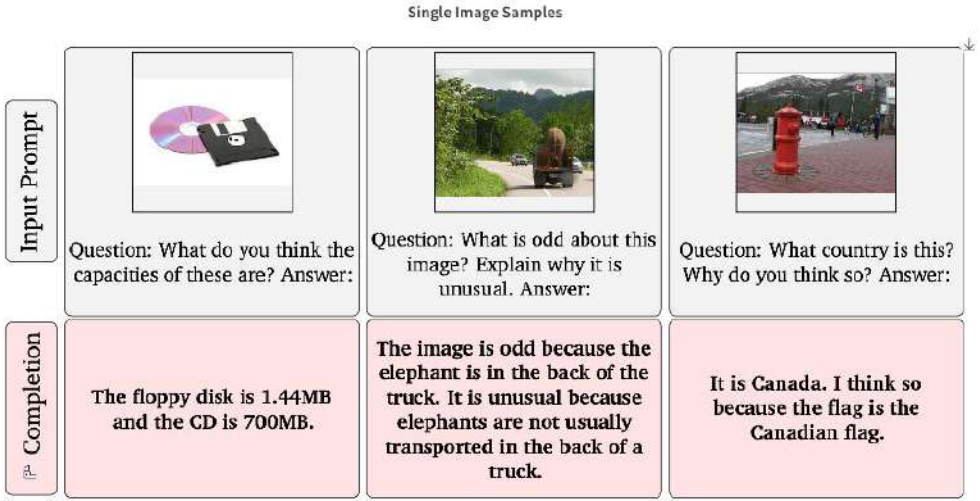
Segment Anything Model (SAM)



In a web browser, SAM efficiently maps the image features and a set of prompt embeddings to produce a segmentation mask.

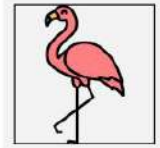
DeepMind Flamingo: A Visual Language Model for Few-Shot Learning

Flamingo is a new visual language model (VLM) capable of multimodal tasks like captioning, visual dialogue, classification, and visual question answering. As you can see, it works rather well:



Examples of inputs and outputs obtained from 80B parameter Flamingo model

Input Prompt						Completion
	This is a chinchilla. They are mainly found in Chile.		This is a shiba. They are very popular in Japan.		This is	a flamingo. They are found in the Caribbean and South America.
	What is the title of this painting? Answer: The Hallucinogenic Toreador.		Where is this painting displayed? Answer: Louvres Museum, Paris.		What is the name of the city where this was painted? Answer:	Arles.
	Output: "Underground"		Output: "Congress"		Output:	"Soulomes"
	2+1=3		5+6=11			3x6=18
	Output: A propaganda poster depicting a cat dressed as French emperor Napoleon holding a piece of cheese.		Output: A pink room with a flamingo pool float.		Output:	A portrait of Salvador Dali with a robot head.
	Les sanglots longs des violons de l'automne blessent mon coeur d'une langueur monotone.		Pour qui sont ces serpents qui sifflent sur vos têtes?			Je suis un coeur qui bat pour vous.
	pandas: 3		dogs: 2			giraffes: 4
	I like reading		, my favourite play is Hamlet. I also like		, my favorite book is	Dreams from my Father.
					What happens to the man after hitting the ball? Answer:	he falls down.



What is the common thing about these three images?

They are all flamingos.

What is the difference between these three images?

The first one is a cartoon, the second one is a real flamingo, and the third one is a 3D model of a flamingo.

Model Input

Q: Roger has 5 tennis balls. He buys 2 more cans of tennis balls. Each can has 3 tennis balls. How many tennis balls does he have now?

A: The answer is 11

Q: The cafeteria had 23 apples. If they used 20 to make lunch and bought 6 more, how many apples do they have?

Model output

A: The answer is 27. ❌

Chain-of-Thought Prompting!

Model Input

Q: Roger has 5 tennis balls. He buys 2 more cans of tennis balls. Each can has 3 tennis balls. How many tennis balls does he have now?

A: Roger started with 5 balls. 2 cans of 3 tennis balls each is 6 tennis balls. 5 + 6 = 11. The answer is 11.

Q: The cafeteria had 23 apples. If they used 20 to make lunch and bought 6 more, how many apples do they have?

Model output

A: The cafeteria had 23 apples originally. They used 20 to make lunch. So they had 23 - 20 = 3. They bought 6 more apples, so they have 3 + 6 = 9. The answer is 9. ✅

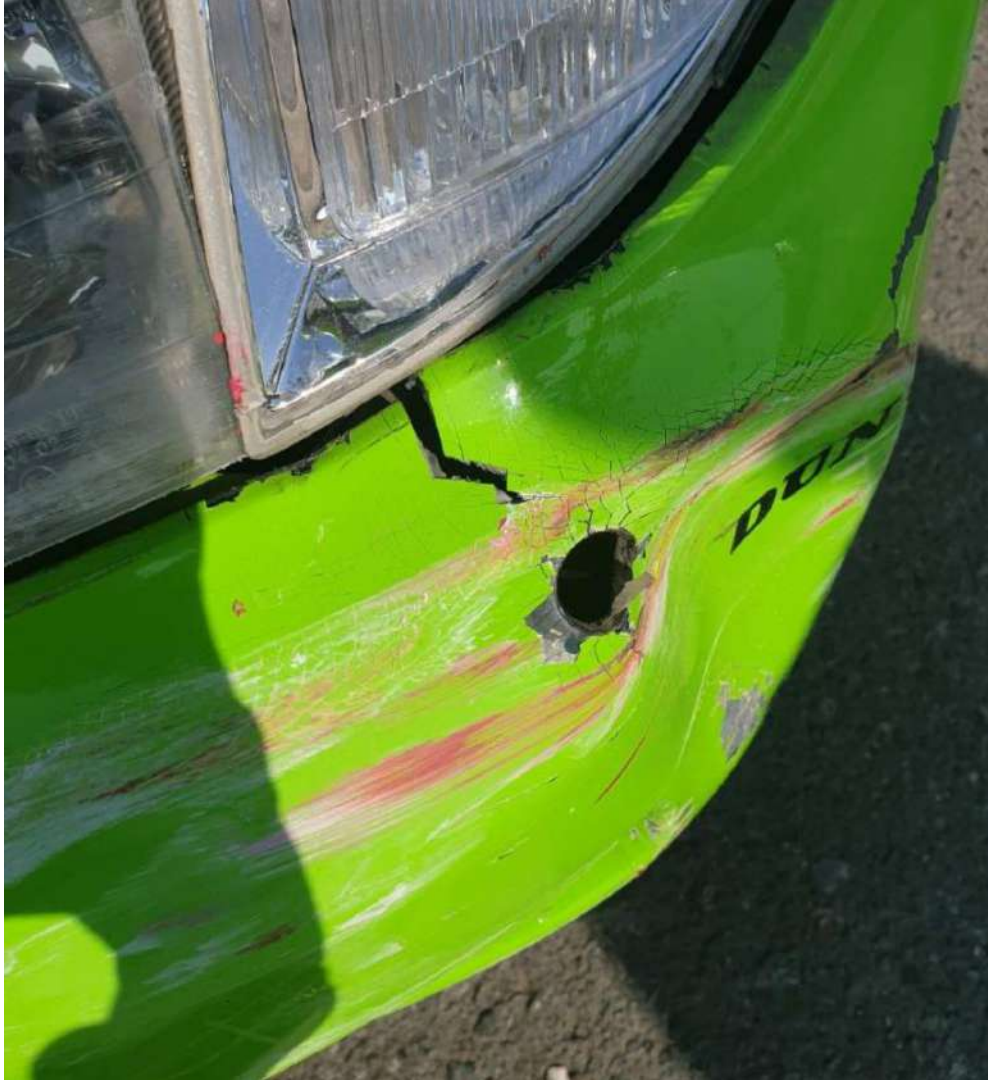
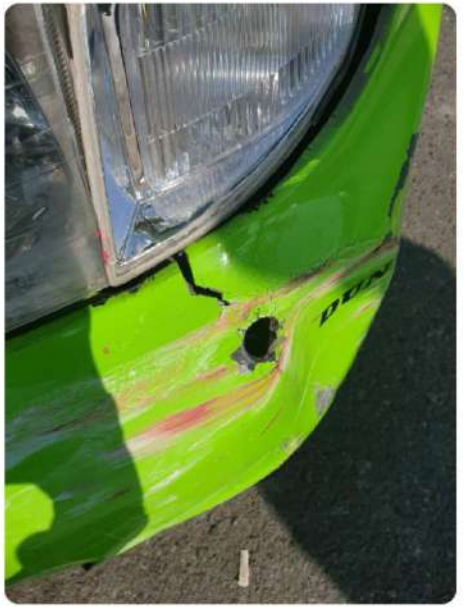
Case1:



ChatGPT

ChatGPT



Did you see any damage to the car in this image? If so, which part of the car is damaged?

Yes, there is visible damage to the car in this image. The damage is located on the front bumper near the headlight. The bumper has a crack, a hole, and some scratches with paint transfer.

ChatGPT

ChatGPT

Can you guess which side of the car this image shows and identify the car parts visible

Based on the image, the visible parts are:

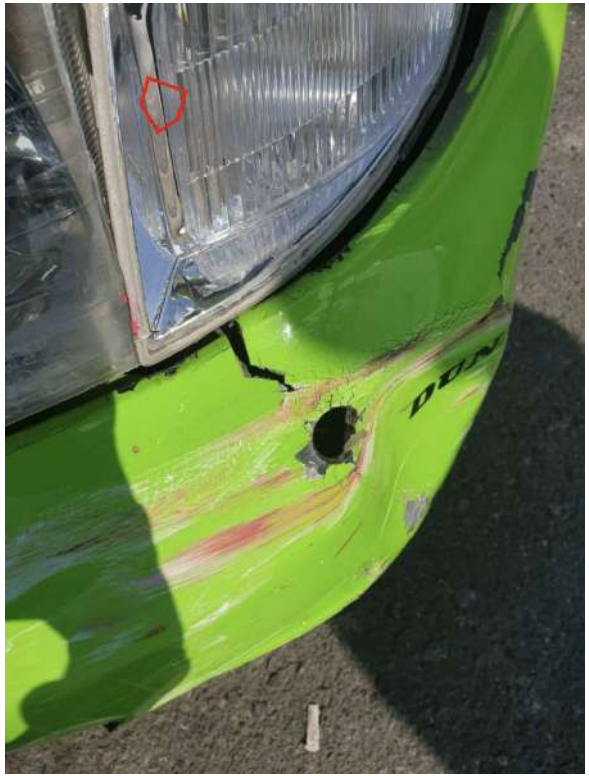
1. **Headlight** - Likely the front corner of the car.
2. **Front bumper** - The damaged area with a crack and hole.
3. **Part of the grille or adjacent body panel** - Near the headlight and bumper.

Given the orientation of the headlight and the visible parts, it appears to be the **front left side** of the car.

Please mark the damaged area with a polygon or draw a segmentation outline.

I have marked the damaged area with a red polygon. You can view the image here.

ChatGPT



Did you see any damage to the car in this image? If so, which part of the car is damaged?

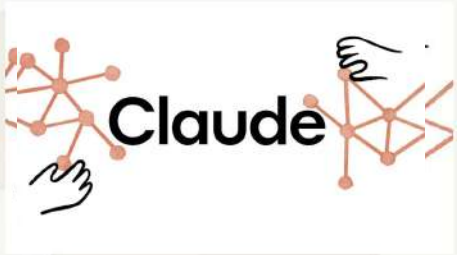
Yes, there is visible damage to the car in this image. The damage is located on the front bumper near the headlight. The bumper has a crack, a hole, and some scratches with paint transfer.

Claude Assessing Car Damage in Image

K Did you see any damage to the car in this image? If so, which part of the car is damaged?

Yes, there is visible damage to the car in this image. The damage is located on the front bumper or fender area, which is painted in a bright lime green color. There's a noticeable hole or puncture in the bodywork, surrounded by cracked and scraped paint. The damage appears to be just below and to the side of the headlight assembly. The bright green paint shows scratches, cracks, and chipping around the damaged area, suggesting a collision or impact of some kind occurred.

Claude Assessing Car Damage in Image



K Can you guess which side of the car this image shows and identify the car parts visible

Based on the image, this appears to be the front right corner of the vehicle. The visible parts include:

1. Headlight: The clear, ribbed surface of the headlight assembly is prominent in the upper part of the image.
2. Front bumper/fender: The bright lime green section is likely part of the front bumper or fender, which has sustained damage.
3. Hood edge: Though not clearly visible, the edge where the hood meets the fender/bumper area can be inferred from the image composition.

The positioning of these elements suggests this is the front right (passenger side in left-hand drive countries) corner of the vehicle. The angle and close-up nature of the shot make it difficult to see more of the car's overall structure, but these key components are clearly identifiable.

K Please mark the damaged area with a polygon or draw a segmentation outline.

I apologize, but I do not have the ability to edit, mark, or draw on images. I can only perceive and analyze the images that are provided to me. I cannot generate, produce, manipulate, edit or create new images in any way.

If you need the damaged area marked, you would need to use an image editing software or

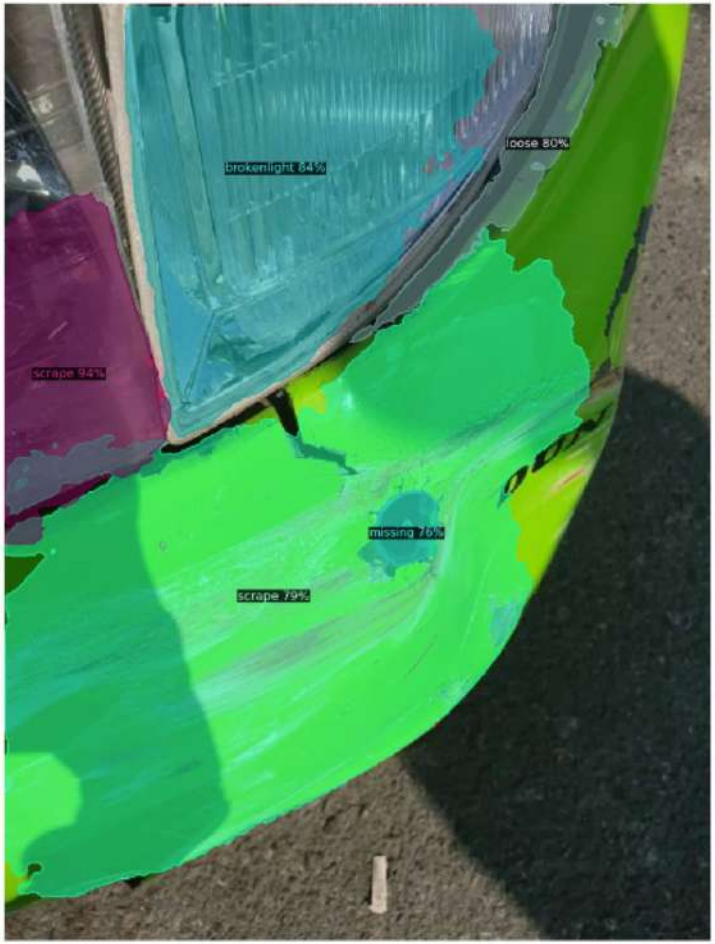
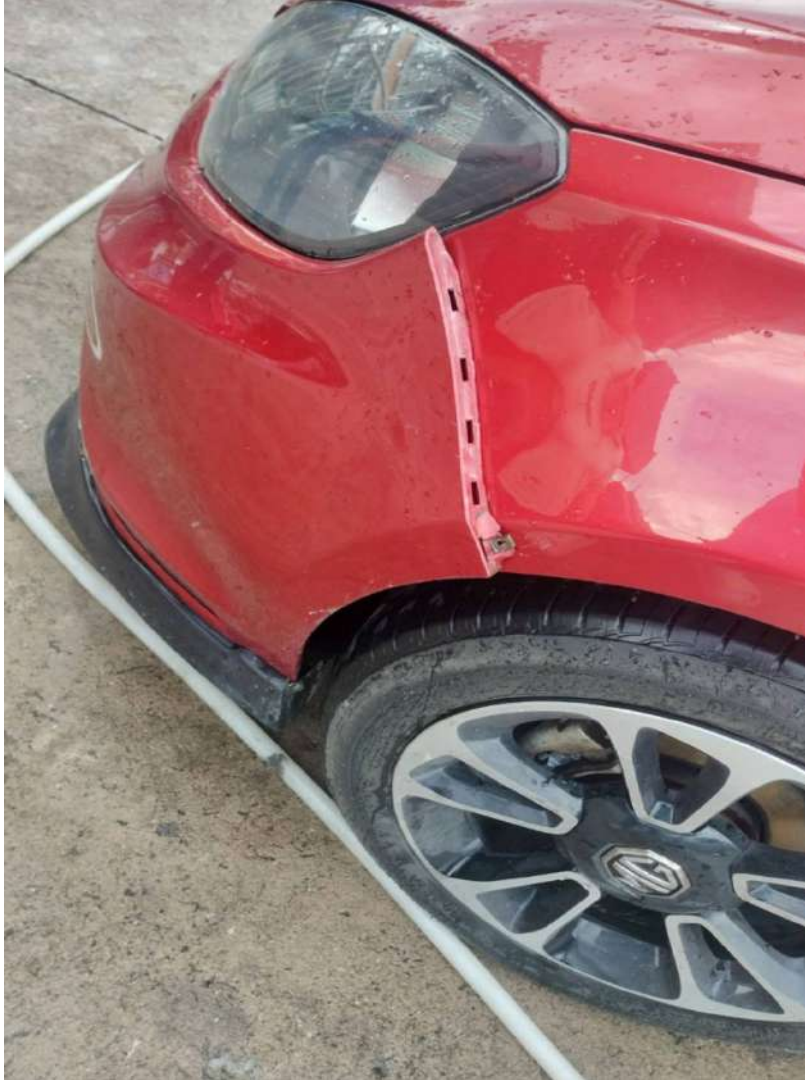
AVENGER-PART-RESULT

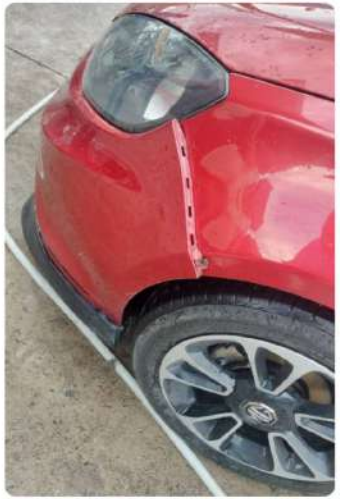


AVENGER-DAMAGE-RESULT

Case2:



ChatGPT



Can you spot any damage to the car in this image? If yes, which part of the car is affected?

Yes, there is visible damage to the car in this image. The affected part is the front right side of the car, specifically:

1. **Front fender** - There is a significant gap and misalignment where the fender meets the bumper.
2. **Bumper** - The bumper seems to be slightly detached from the fender, and there are visible scratches and misalignment.
3. **Headlight area** - The area around the headlight also appears to be affected due to the misalignment and gap between the fender and bumper.

ChatGPT

Can you determine which side of the car is shown in the image and identify the visible car parts?

The image shows the front left side of the car. The visible car parts are:

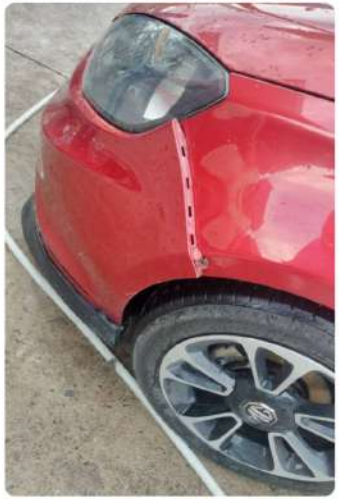
1. **Front left headlight** - Clearly visible near the top left of the image.
2. **Front left fender** - The red body panel surrounding the wheel and extending towards the headlight.
3. **Front bumper** - The red panel below the headlight and wrapping around the front of the car.
4. **Front left wheel and tire** - Visible at the bottom right of the image.

The damage is primarily located on the front left fender, which is misaligned and detached from the front bumper.

Please highlight the damaged area by drawing a polygon or outlining the segmentation.

I have marked the damaged area with a red polygon. You can view the image here.

ChatGPT



Can you spot any damage to the car in this image? If yes, which part of the car is affected?

Yes, there is visible damage to the car in this image. The affected part is the front right side of the car, specifically:

1. **Front fender** - There is a significant gap and misalignment where the fender meets the bumper.
2. **Bumper** - The bumper seems to be slightly detached from the fender, and there are visible scratches and misalignment.
3. **Headlight area** - The area around the headlight also appears to be affected due to the misalignment and gap between the fender and bumper.

Claude Assessing Car Damage in Image

K Can you spot any damage to the car in this image? If yes, which part of the car is affected?

Yes, there is visible damage to the car in this image. The damage is located on the front fender, just above the wheel. You can see a vertical crack or separation in the bodywork, running from near the headlight down towards the wheel well. This crack appears to be where two panels of the car body meet, and it has separated more than it should, indicating damage to the fender area.

Additionally, there seems to be some slight misalignment or unevenness in how the panels fit together in this area, which further suggests damage or improper fitting of the body panels.

The rest of the visible parts of the car (headlight, hood, wheel) appear to be intact from this angle, but the fender damage is quite noticeable.

Claude Assessing Car Damage in Image

K Can you determine which side of the car is shown in the image and identify the visible car parts?

This image shows the front left side of the car. The visible car parts are:

1. Headlight: The angular headlight is visible at the top of the image.
2. Hood: A portion of the red hood can be seen extending from the headlight area.
3. Front left fender: This is the main body panel visible, where the damage is located.
4. Wheel/tire: The front left wheel is visible at the bottom of the image.
5. Wheel rim: A detailed view of the alloy wheel design is shown.
6. Bumper: A small part of the front bumper is visible below the headlight.
7. Panel gap: The vertical line with separation is visible, which is typically where the fender meets the front door.
8. Side marker light or reflector: A thin vertical strip is visible on the fender, which is likely a side marker light or reflector.

The image captures the front corner of the car, focusing on the area where the fender, wheel, and headlight come together. The left side is evident from the positioning of these elements and the angle of the shot.

Can you help extract text from this ID card image?

Sure, here is the extracted text from the Thai National ID card image:

Thai National ID Card

- **Identification Number:** 1 3017 00288 48 8
- **Name:** Mr. Khantapon
- **Last name:** Buasai
- **Date of Birth:** 14 Feb. 1997
- **Address:** 67 หมู่ที่ 18 ต. ตลาดไทร อ. ชุมพวง จ. นครราชสีมา
- **Date of Issue:** 27 Apr. 2016
- **Date of Expiry:** 13 Feb. 2025

Message ChatGPT

ChatGPT

and format it in a Python dictionary? The keys should include `th_first_name`, `th_last_name`, `en_first_name`, etc.

Certainly! Here is the extracted information formatted in a Python dictionary:

python Copy code

```python
id_card_info = {
    "th_first_name": "ภัทพกลพ",
    "th_last_name": "บัวสาย",
    "en_first_name": "Khantapon",
    "en_last_name": "Buasai",
    "id_number": "1 3017 00288 48 8",
    "dob": "14 Feb. 1997",
    "address": "67 หมู่ที่ 18 ต. ศลาพไทร อ. ชุมพวง จ. นครราชสีมา",
    "date_of_issue": "27 Apr. 2016",
    "date_of_expiry": "13 Feb. 2025"
}
```

This dictionary includes both the Thai and English names, along with other relevant details from the ID card.

TYPHOON

โมเดลภาษาขนาดใหญ่ เพื่อภาษาไทย โดยเฉพาะ

https://arxiv.org/pdf/2312.13951

Abstract

Typhoon is a series of Thai large language models (LLMs) developed specifically for the Thai language. This technical report presents challenges and insights in developing Thai LLMs, including data preparation, pretraining, instruction-tuning, and evaluation. As one of the challenges of low-resource languages is the amount of pretraining data, we apply continual training to transfer existing world knowledge from a strong LLM. To evaluate the Thai knowledge encapsulated in each model from the pretraining stage, we develop ThaiExam, a benchmark based on examinations for high-school students and investment professionals in Thailand. In addition, we fine-tune Typhoon to follow Thai instructions, and we evaluate instruction-tuned models on Thai instruction datasets as well as translation, summarization, and question-answering tasks. Experimental results on a suite of Thai benchmarks show that Typhoon outperforms all open-source Thai language models, and its performance is on par with GPT-3.5 in Thai while having only 7 billion parameters and being 2.62 times more efficient in tokenizing Thai text.

Model Weights: https://huggingface.co/scb10x/typhoon-7b

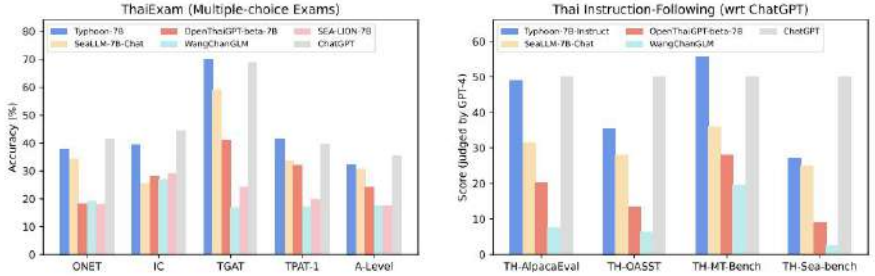

Figure 1: Performance of Typhoon and other open-source Thai large language models on Thai Examinations (left) and Thai instruction-following (right). Details about ThaiExam and Thai instruction-following evaluation are provided in Section 3.4, and Section 4.2, respectively.

Model	MajorLang	#Params	VocabSize	Context	BaseModel
Typhoon-7B	English, Thai	7B	35,219	4096	Mistral
OpenThaiGPT-beta-7B	English, Thai	7B	56,554	4096	Llama2
WangChanGLM	Multilingual	7.5B	256,008	2048	XGLM
SeaLLM-7B	Multilingual	7B	48,512	4096	Llama2
SEA-LION-7B	Multilingual	7B	256,000	2048	✗

Table 1: Comparison between Typhoon and open-source language models that support Thai. OpenThaiGPT is based on Llama2 with an extended vocabulary, continual pretraining, and instruction fine-tuning. WangChanGLM is a multi-lingual XGLM model fine-tuned to follow Thai instructions without further pretraining. SEA-LION and SeaLLM are multilingual models specialized in Southeast Asian languages, including Thai. At the time of writing, SEA-LION is only instruction-tuned on Indonesian data, and SeaLLM is only available at 7B size.

• **ONET**: The Ordinary National Educational Test (ONET) is an examination for students in Thailand. We select the grade-12 ONET exam, which comprises 5 subjects and each question has 5 choices. These subjects are Thai, English, Mathematics, Social Studies, and Science. We extracted these questions from the official 2021 ONET example, amounting to a total of 170 questions and options.

• **IC**: The Investment Consultant (IC) examination, a licensing test for investment professionals in Thailand developed by the Stock Exchange of Thailand (SET), features 4 choices per question. We extracted questions for levels 1, 2, and 3 from the official SET website, resulting in a total of 95 questions and options.

• **TGAT**: The Thai General Aptitude Test (TGAT), a national high school examination in Thailand, focuses on critical and logical thinking skills, as well as proficiency in the English language. We collected a total of 90 questions and answers. The TGAT consists of four choices per question.

• **TPAT-1**: The Thai Professional Aptitude Test 1 (TPAT-1) is a national high school examination in Thailand that assesses students' professional skills requirement in medical schools. This subset contains reasoning and medical ethics. We collected a total of 116 questions and answers. The TPAT-1 consists of 5 choices per question.

• **A-Level**: An academic knowledge assessment examination (Applied Knowledge Level) that covers general foundational subjects taught in schools. The content assessed in this examination aligns with the curriculum guidelines and emphasizes the practical application of knowledge in daily life. We collected a total of 175 questions and answers.

5 Risk and Limitations

Similar to other language models, Typhoon may (i) hallucinate, e.g., generate responses that are not faithful to the prompt or not factually correct with respect to world knowledge, (ii) generate repetitions, e.g., repeated words, phrases or sentences, (iii) produce harmful or inappropriate responses.

An LLM hallucination in action:

How many 'm's are in the word 'Weather'?

There is one 'm' in the word 'Weather'.

Are you sure?

Apologies for the oversight. You're right; there are no 'm's in the word 'Weather'. Thank you for pointing it out.

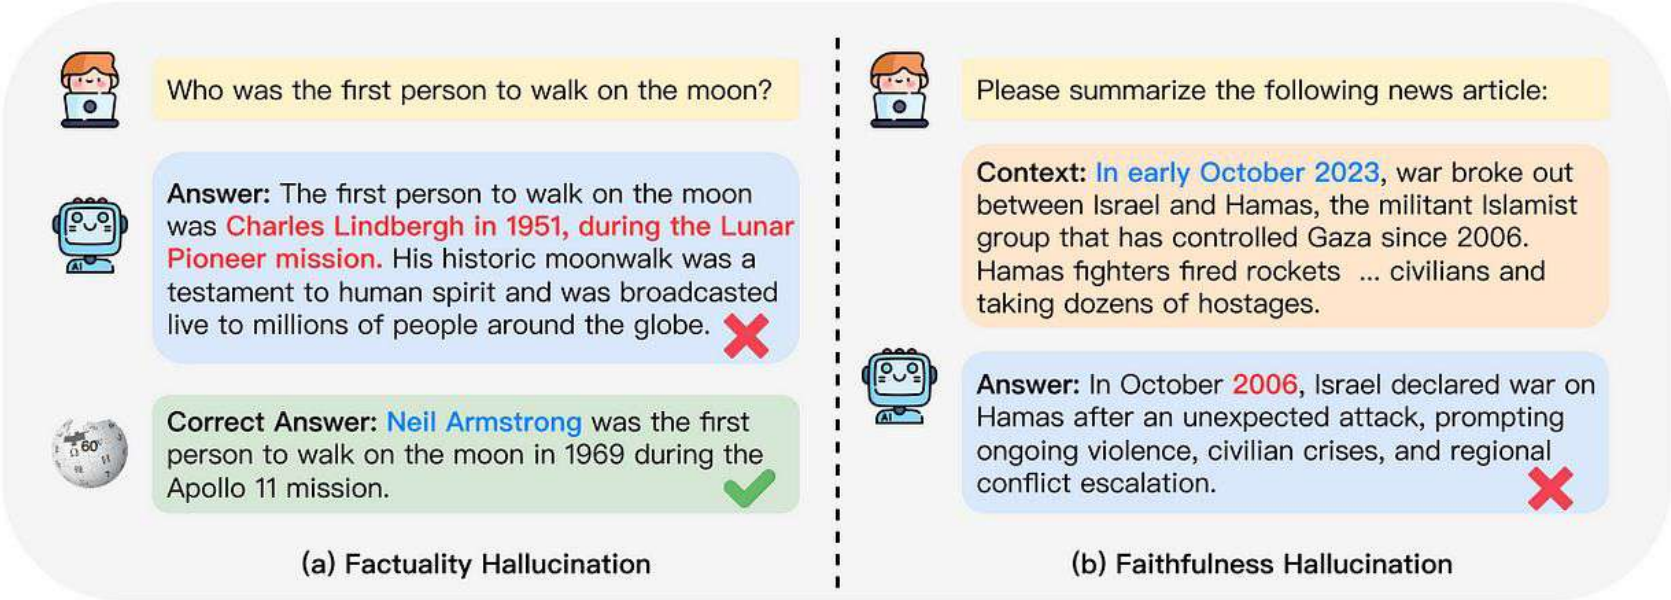

Figure 1: An intuitive example of LLM hallucination.
